

## 0. HTTPie

The first on my list is a tool called [HTTPie](#). Fear not, this tool has nothing to do with Internet Explorer, fortunately. In essence HTTPie is a [cURL](#) wrapper, the utility that performs HTTP requests from the command line. HTTPie adds nice features like auto-formatting and intelligent colour highlighting to the output making it much more readable and useful to the user. Additionally, it takes a very human-centric approach to its execution, not asking you to remember obscure flags and options. To perform an HTTP GET, you simply run *http*, to post you *http POST*, what can be easier or more beautiful?
